

August 15, 2026

Dear Hiring Manager,

I am writing to apply for the Senior Software Engineer (Java Backend) role at Apple. With 8+ years

of experience building fault-tolerant, high-performance distributed systems across AI platforms, core banking, and enterprise insurance, I am confident in my ability to contribute to the critically important applications Apple's engineering teams power at global scale.

At Samsung Electro-Mechanics, I serve as the technical lead for PADO — an internal AI developer

platform running on Kubernetes that manages the full lifecycle of machine learning models across

multiple clusters. I designed and own the platform's microservices architecture in Java / Spring

Boot 3, built event-driven pipelines using Kafka and Redis for distributed state and automated model redeployment, and engineered the SSO identity layer with Keycloak (OAuth2/OIDC) securing

REST API access across Kubeflow, Grafana, and Docker integrations. Applying GoF design patterns,

JUnit / Mockito test suites, and rigorous code review within our CI/CD process has been central

to keeping the platform maintainable and extensible as the team of six engineers I lead continues

to grow it. Before Samsung, I delivered production fixes and schema-level SQL optimizations on

Oracle's Flexcube core banking platform and built a business-critical walk-back handling feature

on the Masterpiece policy-builder at Chubb — experience that sharpened my instinct for correctness and defensive coding in high-stakes environments.

What draws me to this role specifically is the combination of engineering depth and Apple's expectation of reliability at volumes most teams never encounter. I have spent the last three years solving the "build once, deploy to many" problem on Kubernetes, tuning concurrency and performance in multi-threaded Java services, and designing systems that fail gracefully rather than catastrophically. I am eager to bring that mindset to Apple and to grow alongside engineers

who hold the bar equally high.

Resume attached. Warm regards,

Akshay Patwari
