

Dear Hiring Manager,

I am writing to apply for the Senior Software Engineer role at Volvo Group Digital Technology & Operations. With 8+ years of experience taking end-to-end ownership of backend Java services across AI platforms, core banking, and enterprise insurance, I am drawn to Volvo DTO's product-oriented culture where teams own what they build from idea to delivery.

At Samsung Electro-Mechanics, I serve as the technical lead for PADO, an internal AI developer platform built on Java / Spring Boot 3 microservices running on Kubernetes. I design and deliver scalable REST APIs end-to-end — from architecture and coding standards through CI/CD deployment, observability via Grafana monitoring and logging, and ongoing production maintenance — in an agile team environment. A highlight of this work is the platform's identity and security layer, built with Keycloak implementing OAuth 2.0, OpenID Connect, and JWT, which provides governed, secure API access across all integrated tools. I lead a team of six engineers, mentoring them on code quality, design decisions, and best practices while communicating clearly with both technical and non-technical stakeholders to keep solutions aligned with business priorities. Earlier in my career I delivered production SQL optimizations and data fixes on Oracle's Flexcube core banking platform and built a time-critical business feature on the Masterpiece policy-builder application at Chubb — experience that reinforced my discipline around correctness, reliability, and defensive coding.

What excites me about this role is the combination of strong engineering fundamentals and genuine business impact that Volvo DTO describes. I thrive in cross-functional agile teams where I can take broad ownership, raise the quality bar, and contribute to solutions that matter. I would welcome the opportunity to bring that mindset to Volvo Group.

Resume attached.

Warm regards,
